

Block Foundation

An Annotated Bibliography

Lars van Vianen

August 6, 2023

1 Introduction

The Block Foundation is dedicated to reshaping architectural practice and housing systems through the innovative use of blockchain technology, has generated a robust body of work, theoretical discussions, practical explorations, and critical analyses. Our endeavor to create an equilibrium in the real estate market and foster innovative architectural solutions has sparked a diverse range of academic, technical, and professional publications.

This reference bibliography serves as a curated list of key texts and resources that have informed our work and continues to guide our approach. The selection includes seminal writings on blockchain technology, architectural theory and practice, sustainable urban development, digital economies, and decentralized market designs. It also encompasses studies on the intersection of these areas, highlighting the multidisciplinary and integrative nature of our work at the Block Foundation.

The bibliography is organized by topic, facilitating easy access to resources in specific areas of interest. Each entry provides a brief annotation, summarizing the main arguments, methods, and contributions of the work. This resource is aimed to be of value to a broad range of readers: from architects, urban planners, and blockchain developers, to policy makers, investors, and anyone interested in the innovative intersections of architecture, housing systems, and digital technologies.

As our work continues to evolve, so will this bibliography, reflecting our commitment to remain at the forefront of thought and practice in these rapidly changing fields. This collection is not merely a reflection of the past; it is a living document, a tool for critical engagement, and a launchpad for future explorations.

The Block Foundation believes in open dialogue, collaboration, and the sharing of knowledge. We welcome suggestions for additional resources and invite ongoing conversation about the ideas and issues these works present. We hope this bibliography serves as a useful point of departure for these vital discussions.

2 Mechanism Design

The Mechanism Design Sub Bibliography is a curated collection of key resources that delve into the interdisciplinary field of mechanism design and its applications in reshaping architectural practice and housing systems. Mechanism design, drawing from economics, game theory, and computer science, explores the creation of incentive-compatible mechanisms to achieve desirable outcomes in various settings.

At the Block Foundation, we recognize the immense potential of mechanism design in revolutionizing the real estate market and fostering innovative architectural solutions. This abstract provides a concise overview of the collection's content, guiding readers through the wealth of knowledge presented.

The sub bibliography features seminal research papers, academic texts, and practical case studies, offering a comprehensive understanding of the principles and applications of mechanism design. From the foundational theories to practical implementations, readers will gain valuable insights into harnessing incentive mechanisms to foster transparency, efficiency, and fairness in the housing sector.

The resources span diverse topics, including the design of decentralized marketplaces, blockchain-based voting systems, and novel governance structures. Each entry highlights the profound implications of mechanism design in shaping housing systems, land allocation, and community-driven development.

This abstract serves as a roadmap, inviting architects, blockchain developers, policy makers, and urban planners to explore the collection's diverse perspectives. As the Block Foundation remains committed to staying at the forefront of thought and practice, this living document will continuously evolve, reflecting the latest advancements and ideas in mechanism design and its applications in architecture.

We encourage open dialogue, collaboration, and the sharing of knowledge, as this sub bibliography serves as a catalyst for critical engagement and a launchpad for future explorations. Together, let us uncover the transformative power of incentive-driven solutions to create a more equitable, sustainable, and innovative architectural landscape.

Mechanism design, a dynamic field that combines economics, game theory, and computer science, holds significant relevance to the Block Foundation's mission of reshaping architectural practice and housing systems. Mechanism design focuses on creating incentive-compatible mechanisms to achieve desirable outcomes in various settings, ranging from market designs and resource allocation to voting systems and decentralized governance.

At the Block Foundation, the exploration of mechanism design offers an opportunity to innovate and optimize decision-making processes, aligning with its commitment to leveraging blockchain technology and cutting-edge solutions. By understanding the principles of mechanism design, the foundation seeks to foster transparency, efficiency, and fairness in architectural projects and real estate markets.

Mechanism design presents architects, urban planners, and policymakers with a robust toolkit to address complex challenges in housing systems and community-driven development. By exploring decentralized market designs, blockchain-based voting systems, and novel governance structures, the foundation aims to create solutions that enhance community engagement and inclusivity.

Furthermore, the Block Foundation's interest in mechanism design reflects its dedication to open dialogue and collaboration. By engaging with experts from different disciplines, including economists and computer scientists, the foundation aims to synergize the diverse perspectives on mechanism design to create transformative solutions.

As the foundation continues to evolve and stays at the forefront of thought and practice, the exploration of mechanism design offers a fertile ground for groundbreaking approaches and evidence-based solutions. Through this exploration, the Block Foundation endeavors to contribute to a future where mechanism design plays a pivotal role in reshaping architectural

practices, housing systems, and real estate markets for the betterment of communities and individuals alike.

3 Governance

3.1 Decentralized Autonomous Organizations (DAOs)

Decentralized Autonomous Organizations (DAOs) are of profound significance to the Block Foundation’s mission, which seeks to revolutionize architectural practice and real estate markets through pioneering blockchain technology. DAOs represent self-governing entities operating on the blockchain, governed by smart contracts that automate decision-making processes based on consensus among participants.

The Block Foundation’s exploration of DAOs signifies a firm commitment to decentralized governance and community-driven development. Leveraging the potential of DAOs, the foundation endeavors to establish transparent and participatory platforms, facilitating active engagement of stakeholders in decision-making concerning architectural projects and real estate ventures.

In the pursuit of innovative applications, the Block Foundation fosters open dialogue and collaboration with experts specializing in blockchain development and decentralized governance. Embracing DAOs, the foundation envisions a future where architectural communities exercise increased influence over project direction and management, fostering inclusivity and engendering a sense of ownership among stakeholders.

Ultimately, the Block Foundation seeks to contribute to a dynamic architectural landscape where DAOs redefine traditional governance models. By harnessing blockchain technology to empower DAOs, the foundation endeavors to create a decentralized and community-centric real estate market, empowering individuals, promoting sustainable urban development, and cultivating a culture of collaboration and innovation within the architectural domain.

3.2 Private Cities

The Private Cities Sub Bibliography presents a thoughtfully curated collection of key resources that explore the emerging concept of private cities and its impact on architectural practice, urban planning, and housing systems. Private cities, also known as charter cities or special economic zones, are novel urban developments governed by private entities, offering unique opportunities and challenges in reimagining the urban landscape.

As the Block Foundation dedicates itself to fostering innovative architectural solutions and reshaping real estate markets, understanding the theoretical underpinnings and practical implications of private cities becomes increasingly relevant.

This abstract provides a concise overview of the diverse topics covered within the sub bibliography, guiding readers through the breadth of knowledge presented. From foundational works on the principles of private cities to case studies of existing projects, the resources within this collection shed light on the potential role of private cities in addressing urban challenges and transforming traditional housing systems.

The sub bibliography includes influential research papers, academic literature, and policy analyses, exploring the economic, social, and legal aspects of private cities. Readers will encounter discussions on governance models, community engagement, and the integration of blockchain technology in private city development.

The resources delve into the complex interplay between public and private interests, offering insights into how private cities could foster innovation, economic growth, and sus-

tainable urban development. Furthermore, the collection explores ethical considerations and potential implications for urban inequality and social cohesion.

As the Block Foundation remains committed to staying at the forefront of thought and practice, this living document will continuously evolve, reflecting the latest developments and ideas in private city projects and governance models.

We invite architects, urban planners, policymakers, and blockchain enthusiasts to engage with this collection as a valuable resource for critical analysis and forward-thinking. By fostering open dialogue and collaboration, we aspire to collectively explore the transformative potential of private cities in shaping an inclusive, dynamic, and future-oriented architectural landscape.

Private cities, a concept gaining prominence in urban planning and governance, holds significant relevance to the Block Foundation’s mission of reshaping architectural practice and housing systems. Private cities, also known as charter cities or special economic zones, are unique urban developments governed by private entities rather than traditional nation-states.

At the Block Foundation, the exploration of private cities represents an opportunity to reimagine urban spaces and foster innovative solutions for real estate markets. These private cities offer the potential to experiment with alternative governance models, community-driven development, and the integration of cutting-edge technologies like blockchain, which aligns with the foundation’s commitment to innovation and forward-thinking.

By studying existing private city projects and their impact on housing systems and urban development, the Block Foundation seeks to gain valuable insights into the economic, social, and legal aspects of such initiatives. Understanding the dynamics of private city governance can inform the foundation’s efforts to promote transparent, efficient, and sustainable urban development solutions.

Furthermore, the Block Foundation’s interest in private cities reflects its dedication to open dialogue and collaboration. By engaging with policymakers, architects, urban planners, and legal professionals, the foundation aims to explore the potential opportunities and challenges presented by private cities, fostering critical discussions on how they can contribute to an equitable and dynamic architectural landscape.

As the foundation continues to evolve and remain at the forefront of thought and practice, the exploration of private cities offers a fertile ground for innovation and transformation in the field of architecture and real estate markets. Through this exploration, the Block Foundation endeavors to contribute to the creation of a future where private cities play a role in reshaping urban environments and empowering communities through decentralized governance and technology integration.

3.3 Network States

The Network States Sub Bibliography presents a comprehensive collection of key resources exploring the innovative concept of network states and their profound implications for architectural practice, housing systems, and decentralized governance. Network states, a paradigm at the nexus of digital technologies and governance, envision a new form of organization that transcends traditional nation-states and empowers decentralized networks to address societal challenges.

As the Block Foundation strives to reshape architectural practice through blockchain technology and foster equilibrium in real estate markets, understanding the theoretical frameworks and practical applications of network states becomes paramount.

This abstract provides a concise overview of the breadth of topics covered within the sub bibliography, guiding readers through the evolution of the network state concept. From seminal writings on decentralized governance to explorations of blockchain-based voting systems, the resources offer a comprehensive understanding of how network states may

revolutionize the architectural landscape.

The sub bibliography encompasses groundbreaking research papers, academic texts, and thought-provoking case studies, all of which shed light on the potential benefits and challenges associated with network states. Readers will encounter discussions on digital citizenship, identity management, and the role of smart contracts in redefining property ownership and community-driven development.

The resources explore the fusion of technological innovations with governance models, offering insights into the potential for increased transparency, participatory decision-making, and the democratization of public services.

As the Block Foundation remains dedicated to staying at the forefront of thought and practice, this living document will continuously evolve, reflecting the latest advancements and ideas in network states and their applications in architectural contexts.

We invite architects, blockchain developers, policymakers, and individuals intrigued by the innovative intersections of technology and governance to engage with this collection as a valuable resource for transformative ideas and critical reflections. By fostering open dialogue and collaboration, we aspire to collectively explore the potential of network states in shaping a dynamic, equitable, and future-ready architectural landscape.

Network states, an emerging concept at the intersection of digital technologies and governance, holds significant relevance to the Block Foundation's mission of reshaping architectural practice and housing systems. Network states envision a new form of organization beyond traditional nation-states, where decentralized networks play a vital role in decision-making, resource allocation, and community-driven development.

At the Block Foundation, the exploration of network states represents an opportunity to embrace innovative models of decentralized governance, aligning with its commitment to blockchain technology and forward-thinking approaches. By studying the theoretical foundations and practical applications of network states, the foundation seeks to understand how this paradigm can revolutionize the architectural landscape.

Network states present a dynamic framework for architects, urban planners, and policymakers to reimagine urban development, property ownership, and community engagement. By integrating blockchain technology and smart contracts, network states offer the potential for increased transparency, efficiency, and inclusivity in architectural projects and real estate markets.

Furthermore, the Block Foundation's interest in network states reflects its dedication to open dialogue and collaboration. By engaging with experts from diverse fields, including blockchain enthusiasts and governance specialists, the foundation aims to explore the potential synergies between network states and decentralized technologies.

As the foundation evolves and remains committed to thought leadership, the exploration of network states allows for innovative solutions and novel approaches to foster equitable and sustainable architectural practices. Through this exploration, the Block Foundation endeavors to contribute to a future where network states empower individuals, amplify community voices, and reshape architectural systems through decentralized and network-driven governance structures.
